Conditional Poisson processes don't have independent increments, which means they're not Poisson process. But given  $\{N(t) = n\}$  the arrival times are distributed as the order statistics from a set of  $\{n\}$  independent uniform  $\{(0,t)\}$  random variables. Refer the solution for Problem 2.41 in textbook for detail.

I want to know if the book introduction to stochastic processes by Gregory F. Lawler has solution manual or not. I could find a lot of links claiming that on their website we can find the solution manual but non of them were valid. Also, I checked the Amazon website but I couldn't find any explanation about solution manual of this book.

Galton-Watson tree is a branching stochastic process arising from Francis Galton's statistical investigation of the extinction of family names. The process models family names. Each vertex has a random number of offsprings. The figure shows the first four generations of a possible Galton-Watson tree.

### Introduction to Stochastic Processes - Lecture Notes

An introduction to stochastic processes through the use of R. Introduction to Stochastic Processes with R is an accessible and well-balanced presentation of the theory of stochastic processes, with an emphasis on real-world applications of probability theory in the natural and social sciences. The use of simulation, by means of the popular statistical freeware R, makes theoretical results come alive with practical, hands-on demonstrations.
