In the field of physics, which you could view maybe right after mathematics as the purest of the sciences. So you have math, which is very pure, and then on that foundation of math you have physics. And physics really does try to use that mathematics along with some core ideas to explain the phenomena, all the phenomena, of the universe.

The concern for describing the basic phenomena in nature essentially defines the realm of physics. Physics aims to describe the function of everything around us, from the movement of tiny charged particles to the motion of people, cars, and spaceships. In fact, almost everything around you can be described quite accurately by the laws of physics.

This book is a superb introduction to the field of acclerator physics. Starting with a basic knowledge of relativity and E&M is all that is necessary. Edwards and Syphers do a great job of "building" an acclerator in their book and using operating parameters of real world accelerators (mostly the Tevatron) for their numerical examples.
